Title Changes in methadone treatment practices: results from a national panel study, 1988-2000.

Author D'Aunno T, Poliack HA

Source JAMA: 2002 Aug 21;268(7): 850-6.

Abstract | CONTEXT: Results from several studies conducted in the early 1950s showed

that the majority of US methodone meintenance programs did not use treatmen had be majoring to do this best and ords for the care of horoin users. Effective reatment for heroin users is critical given the upsurge in heroin use and the continued rote of injection drug use in the human immunodef hopatilis C apidomics. OB/ECTIVES: To examine the extent to which US

methadone maintenance treatment programs have made changes in the past 12 years to provide adequate methadone doses and to identify factors associated with variation in program partomismos. DESIGN, SETTING, AND

PARTICIPANTS: Program directors and clinical supervisors of nationally

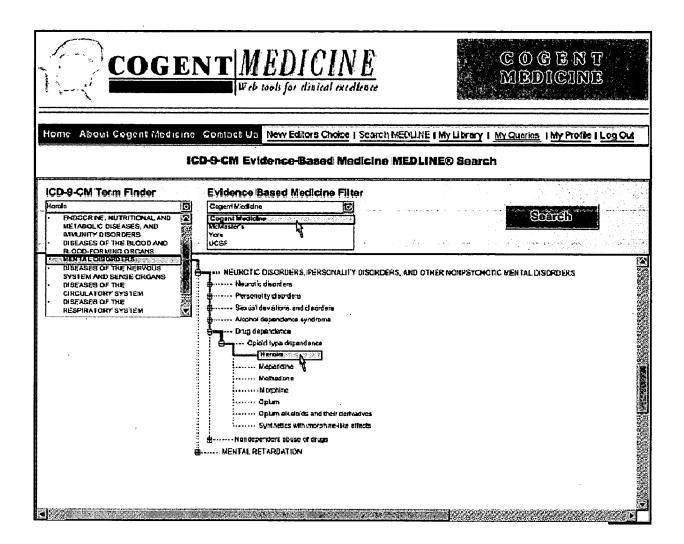

representative methodone beatment programs that varied by ownesthip (for-profit, public, or prhate not-for-profit) and setting (eg., free-standing, hospital-based) were surveyed in 1988 (n = 172), 1990 (n = 140), 1995 (n = 116), and 2000 (n = 150), MAIN OUTCOME MEADURES: Percentage of potients in each reatment program receiving methodone dosages of leas then 40, 60, and 80 mg/ d. RESULTS: The percentage of patients receiving methodone dosage levels less than the recommended 60 mg/d has decreased from 79.5% in 1988 to

35.3% in 2000. Results also show that progrems with a greater percentage of African American patients are especially fixely to dispense low desages, while programs with Joint Commission on Accreditation of Healthcare Organizations accreditation are more likely to provide adequate methadone doses

CONCLUSIONS: Efforts to improve methadone treatment practices appear to be easing progress, but many patients are still receiving substandard care.
